Figure S3. Comparison of the outcomes of the four null models (non-constrained, SB-R ("Suitability-Based Randomisation"), IL-R ("Intra-lineage randomisation") and their combination for the reduced species pool (R-SP) and the extended species pool (E-SP). We chose an intermediate evolutionary scale for IL-R (0.5). The dotted lines represent the significance threshold (0.025 and 0.975); the thick lines separate the communities whose ranks increased with the use of E-SP from those whose ranks decreased with the use of E-SP.
